

Miniature Force Sensor

Type 9210AA...

for Mold Cavity Pressure with Diameter $\varnothing 3,5$ mm

Introduction

Quartz crystal force sensor for a measuring range from 0 to 250 N or for measurement of internal pressure up to 3 000 bar during the injection molding of plastics.

- Minimum size for installation in a mold insert
- Ideal for multi-cavity applications
- Indirect measurement via a measuring pin

Description

This miniature version of the sensor 9210AA... measures the mold cavity pressure via a measuring pin. This pressure value is obtained from the force measured divided by the area of the measuring pin used. The integral single-wire cable with a very small cross-sectional area is designed to allow flexibility of mounting. With the single-wire technique, electrical shielding is guaranteed by the mold. It is therefore essential for the cable and connector to be integrated in the mold.

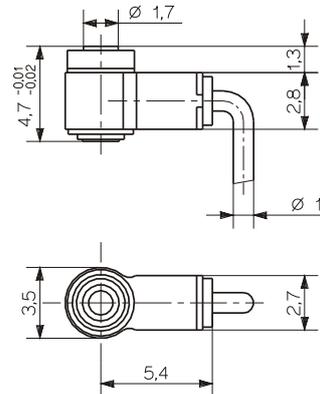

The charge signal (pC = picocoulomb) produced by the force sensor is converted into a proportional output voltage in a charge amplifier or a monitor. The maximum possible output voltage at the standard amplifier is 10 V, which corresponds to the maximum pressure value depending on the measuring pin area.

For multi-cavity applications the sensor Type 9210AAG without connector is used. The multichannel connectors Type 1708A... and 1710A... connect up to 4, respectively 8 sensors.

Application

The sensor is primarily suitable for industrial applications in optimising, monitoring and controlling injection molding of thermoplastics.

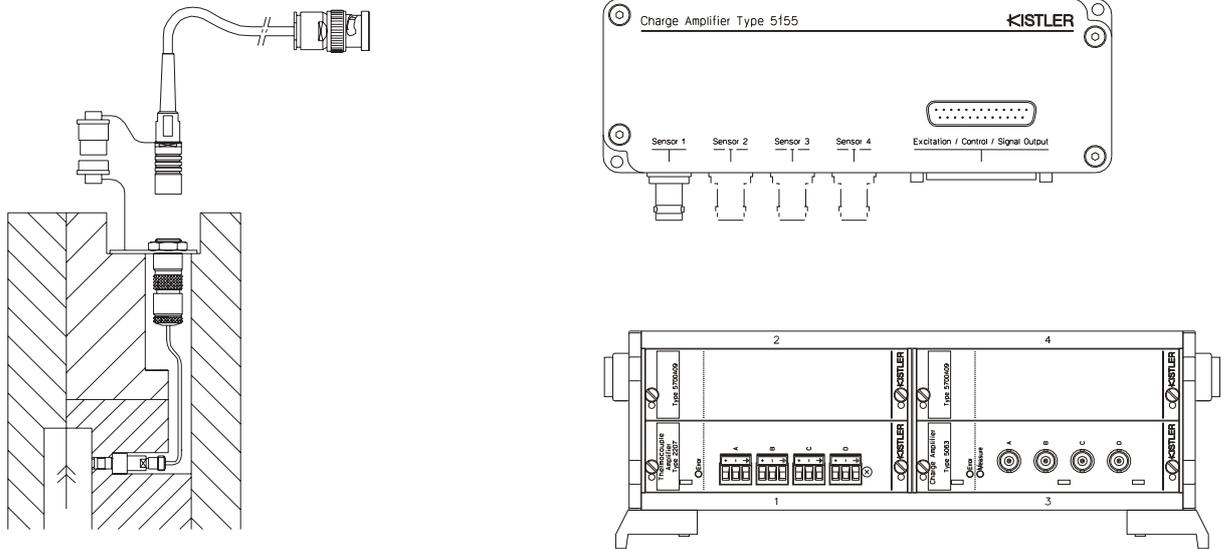

The miniature sensor has been specially developed for mounting in multi-cavity molds where there is limited space. The sensor can be mounted directly under a mold insert by means of the lateral cable outlet. At the side, the sensor is secured via the case against rotation. Mounting is facilitated by using a measuring pin (for example a standart ejector pin). The pin can be adapted in situ to any cavity.

Technical Data

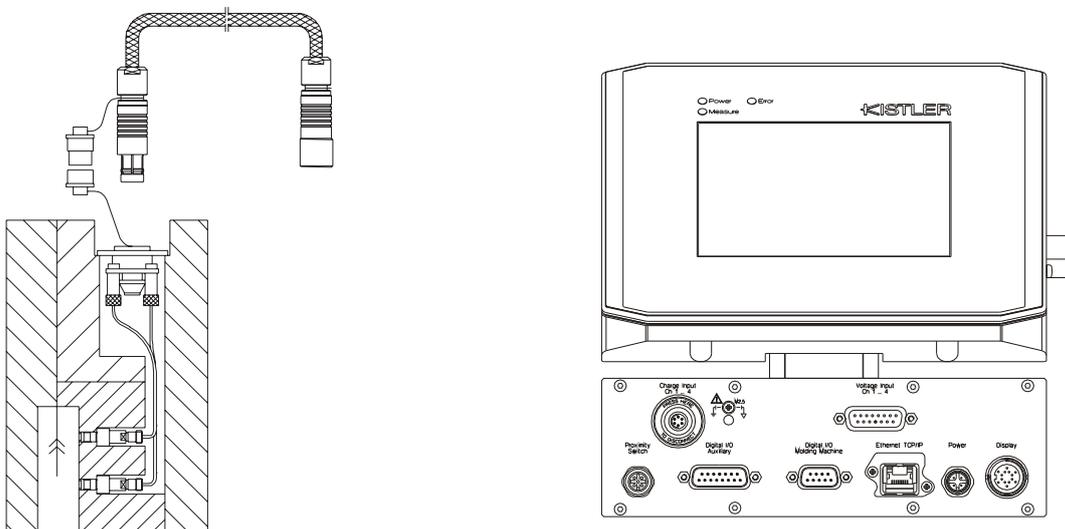

Measuring range	N	0 ... 250
Overload	N	300
Sensitivity	pC/N	-11

Calculation of Sensitivity for Pressure Measurement

When mounting the force sensor for pressure measurement, the front area of the measuring pin must be considered. The nominal sensor sensitivity (pC/N) is converted into a corresponding pressure sensitivity using the following formula.

$$\text{Calculated pressure sensitivity [pC/bar]} = \frac{\text{Nominal force sensitivity [pC/N]} \cdot \text{area of the ejector pin [mm}^2\text{]}}{0,1}$$

The measuring range of the sensor must be taken into account when selecting the measuring pin. The larger the area of the measuring pin, the higher will be the force on the sensor.

The following table shows the calculated sensitivity with the nominal sensitivity of Type 9210AA... and the maximum pressure for selecting the measuring pin.

Measuring Pin Diameter [mm]	Sensitivity [pC/bar]	Maximum Pressure [bar]
1,0	-0,82	3 000
1,2	-1,18	2 500
1,4	-1,61	1 800
1,6	-2,11	1 400
1,8	-2,67	1 100
2,0	-3,29	900
2,2	-3,99	750

Mounting

The miniature force sensor has a very finely ground front face. The contact surface of the measuring pin should also be finely machined, flat, rigid and exactly parallel. The hardened thrust washer Type 9406 supplied should be used when mounting have in a blind hole. When selecting a measuring pin, a normal commercial injector pin can be used. When mounted, the sensor must not have any preload. The measuring pin must be installed with a clearance of from 0,01 to 0,03 mm (Fig. 3).

The single-wire cable must be installed completely in the mold. The connector supplied must be mounted with the single-wire cable cut to size but with its insulation intact. This is then inserted with the mounting plate in the mold and secured. The nameplate should also be affixed alongside it giving details of the type of sensor and its sensitivity.

Accessories Included

- Thrust washer
- Connector with short-circuit cap
- Mounting plate
- Identification plate

Miniature Force Sensor

Type 9213B...

for Mold Cavity Pressure with diameter 6 mm and M2,5 thread

Quartz force sensor for the measuring range from 0 ... 2 500 N or for measuring mold cavity pressure of up to >3 000 bar during injection molding of plastics.

- Case with M2,5 mounting thread
- Replaceable cable
- Available with singlewire technology

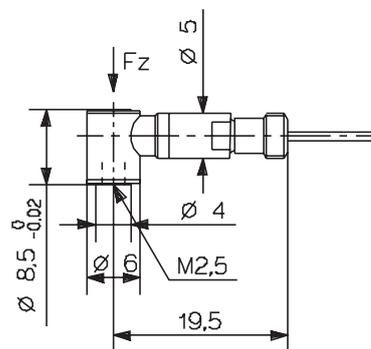

Description

The Type 9213B... miniature sensor offers high resolution and has extremely small dimensions and a rugged, welded case. The charge signal (pC = pico coulombs) output by the force sensor is converted in the Kistler charge amplifier or in a monitoring unit into a proportional output voltage that is largely independent of the length of the sensor cable. The maximum possible output voltage from the standard amplifier is 10 V. In the most sensitive range this gives 1 N/V. The replaceable cables allow a wide choice of connecting cables, including the singlewire version. With singlewire technology an individual cable is shortened to the required length and connected to the connector using the proven cut and grip technique. With this arrangement the mold serves as a shield for signal transmission.

For multi cavity applications the sensor Type 9213B... is used without the singlewire connector Typ 1839. For 4-channel applications the Sensor Type 9213B... is mounted with the Multi-Channel Connector Type 1708... and for 8-channel applications with the Multi-Channel Connector Type 1710...

Application

Thanks to its compactness the miniature force sensor is suitable for dynamic and quasistatic force measurements. This is particularly useful for an application like injection molding, where space is critical and forces are high. Indirect pressure measurement is particularly suitable for molds with small cavities or a large number of ejectors. The sensor is positioned under the ejector pin in the ejector plate, and measures the force curve by means of the ejector. This allows calculation of the actual mold cavity pressure.

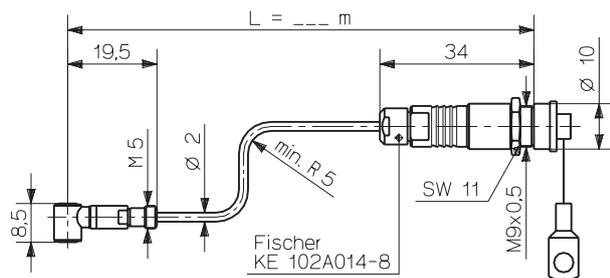

Fig. 2: Force Sensor Type 9213Bsp with cable and connector (standard length: 0,2/0,4/0,6/0,8/1,2 m)

Computation of Sensitivity for the Pressure Measurement

The front face of the ejector pin must be taken into account when mounting the force sensor for pressure measurement. The nominal sensor sensitivity (pC/N) is converted into a corresponding pressure sensitivity using the following formula.

$$\text{Calculated pressure sensitivity [pC/bar]} = \text{Nominal force sensitivity [pC/N]} \cdot \text{area of ejector pin [mm}^2\text{]} \cdot 0.1$$

The measuring range of the sensor must be taken into account when choosing the ejector pins. The larger the ejector pin area the higher the force on the sensor.

The following table shows the calculated sensitivity with the nominal sensitivity of the Type 9213B... and the maximum pressure for a selection of ejector pins.

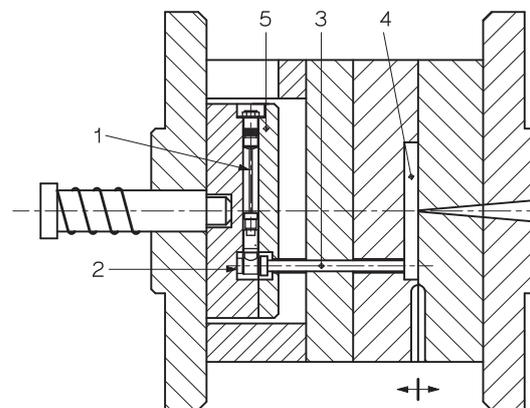

Diameter ejector pin [mm]	Sensitivity [pC/bar]	Maximum pressure [bar]
1,6	-0,88	>3 000
2	-1,38	
2,5	-2,16	
3	-3,11	
4	-5,53	2 000
5	-8,64	1 250

Mounting

The miniature force sensor has a precision ground face. The bearing surface of the ejector pin must also be finely machined, flat, rigid and exactly parallel. A hardened thrust washer must be used when mounting in a blind hole. The sensor can be mounted from below with an M2,5 screw. Once mounted the sensor must not have any preload. A clearance of 0.03mm is recommended.

When using the singlewire technology, it must be ensured that the single-wire cable is kept in the ejector plate and that the Type 1839 connector is also mounted in this plate. When installing the connector in a different plate, electrical shielding by the mold must be ensured.

Die vom Sensor abgegebene elektrische Ladung (Pc = Picocoulomb) wird durch den Kistler Ladungsverstärker in eine proportionale Spannung von 0 ... 10 V DC umgewandelt. Die Länge des Sensorkabels hat keinen Einfluss.

La charge électrique produite par le capteur (en Pc = picocoulomb) est transformée par l'amplificateur Kistler en une tension proportionnelle de 0 à 10 V CC. La longueur du câble du capteur n'a aucune influence.

The electric charge from the sensor (pC = picocoulomb) is converted by the Kistler charge amplifier into a proportional voltage of 0 ... 10 V DC. The length of the sensor cable has no influence.

Beschreibung

PinSens Typ 9204B... ist ein einfach aufgebauter Kraftsensor für die indirekte Werkzeuginnendruckmessung hinter einem Mess- oder Auswerferstift. Dabei muss der Durchmesser des Mess- bzw. Auswerferstiftes bei der Umrechnung von Kraft auf Druck berücksichtigt werden.

Die Aussenabmessungen entsprechen den üblichen 1/2" x 3/8" Einbaunuten. Der Sensor kann mit der mitgelieferten Schraube befestigt werden.

Description

PinSens de type 9204B... est un capteur de conception simple pour la mesure de la pression dans l'empreinte au moyen d'une tige de mesure ou d'éjection. Son diamètre doit être pris en considération pour la conversion de la pression en force.

Les dimensions extérieures correspondent à celles des rainures d'insertion (1/2" x 3/8"). Le capteur peut être fixé au moyen de la vis livrée avec lui.

Description

PinSens Type 9204B... is a simply constructed force sensor for indirect mold cavity pressure measurement behind a measuring or ejector pin. The diameter of the measuring or ejector pin must be taken into account in the conversion from force to pressure.

The outer dimensions correspond to the usual 1/2" x 3/8" mounting grooves. The sensor can be secured with the screw supplied.

Anwendung

Während der Werkzeuginnendruck in industriellen Anwendungen in der Regel direkt in der Werkzeugkavität gemessen wird, gibt es Situationen, in denen dies z.B. aus Platzgründen nicht möglich ist.

PinSens ist eine kostengünstige Alternative für diese Fälle.

Umrechnungstabelle

Gerechnet mit der nominellen Empfindlichkeit von 1,6 pC/N

Formel:

Auswerferstift – Fläche [mm²] x 0,1 x Sensorempfindlichkeit [pC/N]

Formule:

Tige d'éjection – surface [mm²] x 0,1 x sensibilité du capteur [pC/N]

Formula:

Ejector pin - area [mm²] x 0,1 x sensor sensitivity [pC/N]

Applications

Dans les applications industrielles, on mesure la plupart du temps la pression à l'intérieur de l'empreinte directement dans la cavité, il est des situations dans lesquelles ce n'est pas possible pour diverses raisons (manque de place, par exemple).

PinSens constitue une alternative avantageuse dans ces cas.
